Test Simulation

Simulation

The simulation mode is available at any time - even if the payment method for your MerchantId is already live / productive.

The simulation mode is initiated by setting the "OrderDesc" parameter with the value "Test:<nnnn>", where <nnnn> can be various error codes. Please note, that in simulation mode only numeric error codes can be used.

The simulation mode has priority over the live mode.

Value for OrderDesc	English
OrderDesc=Test:0000	Payment process is always successful
OrderDesc=Test:0305	Credit card has been rejected by the acquirer / issuer

Special notes

ⓘ The simulation mode does not use any connection to downstream systems.

Therefore, for example, the following features may not be available in simulation mode:

- Extended transaction management (ETM) for automatic renewal of authorizations
- 3-D Secure response data

ⓘ If ApprovalCode is missing pls. contact Computop Helpdesk to enable configuration.
